Port 21 - FTP

- Requesting countries in feed: United States Belgium Australia United Kingdom Germany China Taiwan Bulgaria France Netherlands.
- FTP-family services are targeted for cleartext credentials, anonymous login, brute force, and vulnerable server builds.
- Prefer SFTP/SSH, disable anonymous access, enforce TLS where retained, and restrict writable directories.
- Known CVE examples for common products on this port: CVE-2011-2523, CVE-2015-3306. Validate against the actual product and version.
- External vulnerability sources: NVD CVE lookup; CISA KEV exploited-CVE catalog; Exploit-DB public exploit search.

Port 22 - SSH

- Requesting countries in feed: United States China Netherlands United Kingdom Nigeria Bulgaria Russian Federation Hong Kong Germany Romania.
- SSH is commonly attacked through password spraying, stolen keys, exposed legacy ciphers, and vulnerable appliances.
- Require MFA or key-only login, disable root/password access, rate-limit attempts, and restrict source networks.
- Known CVE examples for common products on this port: CVE-2024-6387, CVE-2023-48795. Validate against the actual product and version.
- External vulnerability sources: NVD CVE lookup; CISA KEV exploited-CVE catalog; Exploit-DB public exploit search.

Port 23 - Telnet

- Requesting countries in feed: United States Singapore South Africa Japan Indonesia Netherlands Qatar Germany United Kingdom India.
- Cleartext remote login is frequently targeted for default credentials and botnet recruitment.
- Disable Telnet on Internet-facing systems; use SSH with key-based access through a restricted management path.
- Known CVE examples for common products on this port: CVE-2017-17215, CVE-2021-35394. Validate against the actual product and version.
- External vulnerability sources: NVD CVE lookup; CISA KEV exploited-CVE catalog; Exploit-DB public exploit search.

Port 25 - SMTP

- Requesting countries in feed: United States Belgium United Kingdom Bulgaria Netherlands Germany Brazil China Turkey Australia.
- Mail services are probed for open relay, credential stuffing, mailbox exposure, and outdated TLS or server software.
- Enforce modern TLS, strong auth, relay restrictions, rate limits, and mailbox anomaly monitoring.
- Known CVE examples for common products on this port: CVE-2019-15846, CVE-2023-42115. Validate against the actual product and version.
- External vulnerability sources: NVD CVE lookup; CISA KEV exploited-CVE catalog; Exploit-DB public exploit search.

Port 53 - DNS

- Requesting countries in feed: United States Belgium Netherlands Hong Kong United Kingdom China Germany France Iran, Islamic Republic of Bulgaria.
- UDP-oriented services can leak information or be abused for reflection, amplification, and device discovery.
- Disable public recursion/discovery, restrict management communities, patch firmware, and filter unsolicited traffic.
- Known CVE examples for common products on this port: CVE-2023-50387, CVE-2020-8617. Validate against the actual product and version.
- External vulnerability sources: NVD CVE lookup; CISA KEV exploited-CVE catalog; Exploit-DB public exploit search.

Port 68 - DHCP client

- Requesting countries in feed: New Zealand United States Bulgaria France Germany Seychelles Spain Taiwan.
- Observed scanning suggests attackers are testing for exposed services, product-specific backdoors, weak credentials, or stale software.
- Identify the listener, confirm business need, patch the owning system, and restrict public access with deny-by-default rules.
- Known CVE examples: no reliable generic CVE mapping for this port alone; use the NVD and CISA lookups below with the confirmed product and version.
- External vulnerability sources: NVD CVE lookup; CISA KEV exploited-CVE catalog; Exploit-DB public exploit search.

Port 80 - HTTP

- Requesting countries in feed: United States Hong Kong Netherlands Germany United Kingdom Pakistan France China Spain Brazil.
- Web and admin interfaces are common paths for authentication bypass, RCE, file upload, SSRF, and exposed panels.
- Patch frameworks and appliances, remove default credentials, enforce TLS and MFA, and place admin paths behind VPN or allowlists.
- Known CVE examples for common products on this port: CVE-2025-24813, CVE-2024-3400, CVE-2023-3519, CVE-2021-41773. Validate against the actual product and version.
- External vulnerability sources: NVD CVE lookup; CISA KEV exploited-CVE catalog; Exploit-DB public exploit search; OWASP web risk categories.

Port 81 - alternate HTTP

- Requesting countries in feed: United States Spain Iran, Islamic Republic of Korea, Republic of Bulgaria China United Kingdom Germany Hong Kong Japan.
- Web and admin interfaces are common paths for authentication bypass, RCE, file upload, SSRF, and exposed panels.
- Patch frameworks and appliances, remove default credentials, enforce TLS and MFA, and place admin paths behind VPN or allowlists.
- Known CVE examples for common products on this port: CVE-2025-24813, CVE-2024-3400, CVE-2023-3519, CVE-2021-41773. Validate against the actual product and version.
- External vulnerability sources: NVD CVE lookup; CISA KEV exploited-CVE catalog; Exploit-DB public exploit search; OWASP web risk categories.

Port 82 - alternate HTTP

- Requesting countries in feed: United States Spain Bulgaria Korea, Republic of Germany Taiwan Hong Kong China United Kingdom Belgium.
- Web and admin interfaces are common paths for authentication bypass, RCE, file upload, SSRF, and exposed panels.
- Patch frameworks and appliances, remove default credentials, enforce TLS and MFA, and place admin paths behind VPN or allowlists.
- Known CVE examples for common products on this port: CVE-2025-24813, CVE-2024-3400, CVE-2023-3519, CVE-2021-41773. Validate against the actual product and version.
- External vulnerability sources: NVD CVE lookup; CISA KEV exploited-CVE catalog; Exploit-DB public exploit search; OWASP web risk categories.

Port 83 - alternate HTTP

- Requesting countries in feed: United States Spain Bulgaria Korea, Republic of Netherlands France China Hong Kong United Kingdom Germany.
- Web and admin interfaces are common paths for authentication bypass, RCE, file upload, SSRF, and exposed panels.
- Patch frameworks and appliances, remove default credentials, enforce TLS and MFA, and place admin paths behind VPN or allowlists.
- Known CVE examples for common products on this port: CVE-2025-24813, CVE-2024-3400, CVE-2023-3519, CVE-2021-41773. Validate against the actual product and version.
- External vulnerability sources: NVD CVE lookup; CISA KEV exploited-CVE catalog; Exploit-DB public exploit search; OWASP web risk categories.

Port 85 - alternate HTTP

- Requesting countries in feed: United States Spain Iran, Islamic Republic of Bulgaria Korea, Republic of China France Romania United Kingdom Australia.
- Web and admin interfaces are common paths for authentication bypass, RCE, file upload, SSRF, and exposed panels.
- Patch frameworks and appliances, remove default credentials, enforce TLS and MFA, and place admin paths behind VPN or allowlists.
- Known CVE examples for common products on this port: CVE-2025-24813, CVE-2024-3400, CVE-2023-3519, CVE-2021-41773. Validate against the actual product and version.
- External vulnerability sources: NVD CVE lookup; CISA KEV exploited-CVE catalog; Exploit-DB public exploit search; OWASP web risk categories.

Port 88 - Kerberos

- Requesting countries in feed: United States Iran, Islamic Republic of Spain France Germany Korea, Republic of United Kingdom Bulgaria China Netherlands.
- Observed scanning suggests attackers are testing for exposed services, product-specific backdoors, weak credentials, or stale software.
- Identify the listener, confirm business need, patch the owning system, and restrict public access with deny-by-default rules.
- Known CVE examples for common products on this port: CVE-2022-37966, CVE-2021-42278. Validate against the actual product and version.
- External vulnerability sources: NVD CVE lookup; CISA KEV exploited-CVE catalog; Exploit-DB public exploit search.

Port 102 - Siemens S7 / ISO-TSAP

- Requesting countries in feed: United States China United Kingdom France Germany Hong Kong Taiwan Australia Netherlands Portugal.
- Industrial, router, and IoT management services often expose unauthenticated commands, default passwords, and old firmware.
- Do not expose directly; segment networks, update firmware, disable unused management APIs, and allowlist operators.
- Known CVE examples: no reliable generic CVE mapping for this port alone; use the NVD and CISA lookups below with the confirmed product and version.
- External vulnerability sources: NVD CVE lookup; CISA KEV exploited-CVE catalog; Exploit-DB public exploit search.

Port 110 - POP3

- Requesting countries in feed: United States Belgium China United Kingdom Bulgaria Germany France Taiwan Australia Hong Kong.
- Mail services are probed for open relay, credential stuffing, mailbox exposure, and outdated TLS or server software.
- Enforce modern TLS, strong auth, relay restrictions, rate limits, and mailbox anomaly monitoring.
- Known CVE examples for common products on this port: CVE-2019-15846, CVE-2023-42115. Validate against the actual product and version.
- External vulnerability sources: NVD CVE lookup; CISA KEV exploited-CVE catalog; Exploit-DB public exploit search.

Port 111 - rpcbind

- Requesting countries in feed: United States United Kingdom Hong Kong China Taiwan Russian Federation France Bulgaria Germany India.
- Observed scanning suggests attackers are testing for exposed services, product-specific backdoors, weak credentials, or stale software.
- Identify the listener, confirm business need, patch the owning system, and restrict public access with deny-by-default rules.
- Known CVE examples for common products on this port: CVE-2017-8779. Validate against the actual product and version.
- External vulnerability sources: NVD CVE lookup; CISA KEV exploited-CVE catalog; Exploit-DB public exploit search.

Port 123 - NTP

- Requesting countries in feed: China United States Taiwan Korea, Republic of Iran, Islamic Republic of Germany Romania Ukraine United Kingdom Belgium.
- UDP-oriented services can leak information or be abused for reflection, amplification, and device discovery.
- Disable public recursion/discovery, restrict management communities, patch firmware, and filter unsolicited traffic.
- Known CVE examples for common products on this port: CVE-2014-9295, CVE-2015-7704. Validate against the actual product and version.
- External vulnerability sources: NVD CVE lookup; CISA KEV exploited-CVE catalog; Exploit-DB public exploit search.

Port 135 - MS RPC endpoint mapper

- Requesting countries in feed: United States China United Kingdom France Taiwan Germany India Hong Kong Bulgaria Romania.
- Windows remote access surfaces are heavily scanned for weak credentials, lateral-movement services, and historical RCE classes.
- Keep off the public Internet where possible; require VPN, NLA/MFA, current patches, and strict firewall source controls.
- Known CVE examples for common products on this port: CVE-2019-0708, CVE-2020-0796. Validate against the actual product and version.
- External vulnerability sources: NVD CVE lookup; CISA KEV exploited-CVE catalog; Exploit-DB public exploit search.

Port 137 - NetBIOS name service

- Requesting countries in feed: United States France Russian Federation Netherlands Hong Kong Taiwan Portugal Algeria Bulgaria Japan.
- Windows remote access surfaces are heavily scanned for weak credentials, lateral-movement services, and historical RCE classes.
- Keep off the public Internet where possible; require VPN, NLA/MFA, current patches, and strict firewall source controls.
- Known CVE examples for common products on this port: CVE-2017-0144, CVE-2020-0796. Validate against the actual product and version.
- External vulnerability sources: NVD CVE lookup; CISA KEV exploited-CVE catalog; Exploit-DB public exploit search.

Port 139 - NetBIOS session service

- Requesting countries in feed: United States United Kingdom Bulgaria Taiwan India France Australia China Germany Vietnam.
- Windows remote access surfaces are heavily scanned for weak credentials, lateral-movement services, and historical RCE classes.
- Keep off the public Internet where possible; require VPN, NLA/MFA, current patches, and strict firewall source controls.
- Known CVE examples for common products on this port: CVE-2017-0144, CVE-2020-0796. Validate against the actual product and version.
- External vulnerability sources: NVD CVE lookup; CISA KEV exploited-CVE catalog; Exploit-DB public exploit search.

Port 143 - IMAP

- Requesting countries in feed: United States Belgium China Bulgaria Germany Taiwan United Kingdom France Netherlands Hong Kong.
- Mail services are probed for open relay, credential stuffing, mailbox exposure, and outdated TLS or server software.
- Enforce modern TLS, strong auth, relay restrictions, rate limits, and mailbox anomaly monitoring.
- Known CVE examples for common products on this port: CVE-2019-15846, CVE-2023-42115. Validate against the actual product and version.
- External vulnerability sources: NVD CVE lookup; CISA KEV exploited-CVE catalog; Exploit-DB public exploit search.

Port 161 - SNMP

- Requesting countries in feed: United States Germany United Kingdom France Hong Kong Iran, Islamic Republic of Taiwan Romania Portugal China.
- UDP-oriented services can leak information or be abused for reflection, amplification, and device discovery.
- Disable public recursion/discovery, restrict management communities, patch firmware, and filter unsolicited traffic.
- Known CVE examples for common products on this port: CVE-2017-6736, CVE-2022-24805. Validate against the actual product and version.
- External vulnerability sources: NVD CVE lookup; CISA KEV exploited-CVE catalog; Exploit-DB public exploit search.

Port 389 - LDAP

- Requesting countries in feed: United States Netherlands Belgium Iran, Islamic Republic of France China Ukraine Hong Kong Russian Federation Germany.
- Observed scanning suggests attackers are testing for exposed services, product-specific backdoors, weak credentials, or stale software.
- Identify the listener, confirm business need, patch the owning system, and restrict public access with deny-by-default rules.
- Known CVE examples for common products on this port: CVE-2020-25692, CVE-2021-42278. Validate against the actual product and version.
- External vulnerability sources: NVD CVE lookup; CISA KEV exploited-CVE catalog; Exploit-DB public exploit search.

Port 443 - HTTPS

- Requesting countries in feed: United States Bulgaria Germany Netherlands United Kingdom Ukraine China Iran, Islamic Republic of Australia Norway.
- Web and admin interfaces are common paths for authentication bypass, RCE, file upload, SSRF, and exposed panels.
- Patch frameworks and appliances, remove default credentials, enforce TLS and MFA, and place admin paths behind VPN or allowlists.
- Known CVE examples for common products on this port: CVE-2025-24813, CVE-2024-3400, CVE-2023-3519, CVE-2021-41773. Validate against the actual product and version.
- External vulnerability sources: NVD CVE lookup; CISA KEV exploited-CVE catalog; Exploit-DB public exploit search; OWASP web risk categories.

Port 445 - SMB

- Requesting countries in feed: United States China India Vietnam Australia Indonesia Russian Federation Belgium Egypt Kazakhstan.
- Windows remote access surfaces are heavily scanned for weak credentials, lateral-movement services, and historical RCE classes.
- Keep off the public Internet where possible; require VPN, NLA/MFA, current patches, and strict firewall source controls.
- Known CVE examples for common products on this port: CVE-2017-0144, CVE-2020-0796. Validate against the actual product and version.
- External vulnerability sources: NVD CVE lookup; CISA KEV exploited-CVE catalog; Exploit-DB public exploit search.

Port 465 - SMTPS

- Requesting countries in feed: United States United Kingdom Bulgaria Netherlands China Germany Taiwan India Japan Seychelles.
- Mail services are probed for open relay, credential stuffing, mailbox exposure, and outdated TLS or server software.
- Enforce modern TLS, strong auth, relay restrictions, rate limits, and mailbox anomaly monitoring.
- Known CVE examples for common products on this port: CVE-2019-15846, CVE-2023-42115. Validate against the actual product and version.
- External vulnerability sources: NVD CVE lookup; CISA KEV exploited-CVE catalog; Exploit-DB public exploit search.

Port 500 - IKE/IPsec

- Requesting countries in feed: United States Australia France China Hong Kong Taiwan United Kingdom Bulgaria Germany Netherlands.
- VPN endpoints are targeted for credential attacks, weak legacy protocols, exposed portals, and appliance CVEs.
- Use supported protocols, MFA, rapid patching, source-aware monitoring, and lock out repeated failures.
- Known CVE examples for common products on this port: CVE-2023-27997, CVE-2024-21762, CVE-2024-3400. Validate against the actual product and version.
- External vulnerability sources: NVD CVE lookup; CISA KEV exploited-CVE catalog; Exploit-DB public exploit search.

Port 502 - Modbus/TCP

- Requesting countries in feed: United States United Kingdom China Germany Netherlands Taiwan France Hong Kong Portugal Australia.
- Industrial, router, and IoT management services often expose unauthenticated commands, default passwords, and old firmware.
- Do not expose directly; segment networks, update firmware, disable unused management APIs, and allowlist operators.
- Known CVE examples for common products on this port: CVE-2021-30186, CVE-2022-22515. Validate against the actual product and version.
- External vulnerability sources: NVD CVE lookup; CISA KEV exploited-CVE catalog; Exploit-DB public exploit search.

Port 554 - RTSP

- Requesting countries in feed: United States Hong Kong United Kingdom China Germany Bulgaria France India Portugal Taiwan.
- Observed scanning suggests attackers are testing for exposed services, product-specific backdoors, weak credentials, or stale software.
- Identify the listener, confirm business need, patch the owning system, and restrict public access with deny-by-default rules.
- Known CVE examples for common products on this port: CVE-2021-35394, CVE-2020-15893. Validate against the actual product and version.
- External vulnerability sources: NVD CVE lookup; CISA KEV exploited-CVE catalog; Exploit-DB public exploit search.

Port 587 - SMTP submission

- Requesting countries in feed: United States Germany United Kingdom Bulgaria Netherlands China Turkey Hong Kong India Japan.
- Mail services are probed for open relay, credential stuffing, mailbox exposure, and outdated TLS or server software.
- Enforce modern TLS, strong auth, relay restrictions, rate limits, and mailbox anomaly monitoring.
- Known CVE examples for common products on this port: CVE-2019-15846, CVE-2023-42115. Validate against the actual product and version.
- External vulnerability sources: NVD CVE lookup; CISA KEV exploited-CVE catalog; Exploit-DB public exploit search.

Port 990 - FTPS

- Requesting countries in feed: United States Belgium Australia Taiwan China France Germany United Kingdom Bulgaria Canada.
- FTP-family services are targeted for cleartext credentials, anonymous login, brute force, and vulnerable server builds.
- Prefer SFTP/SSH, disable anonymous access, enforce TLS where retained, and restrict writable directories.
- Known CVE examples: no reliable generic CVE mapping for this port alone; use the NVD and CISA lookups below with the confirmed product and version.
- External vulnerability sources: NVD CVE lookup; CISA KEV exploited-CVE catalog; Exploit-DB public exploit search.

Port 993 - IMAPS

- Requesting countries in feed: United States Bulgaria China Germany Taiwan United Kingdom Australia Japan Portugal France.
- Mail services are probed for open relay, credential stuffing, mailbox exposure, and outdated TLS or server software.
- Enforce modern TLS, strong auth, relay restrictions, rate limits, and mailbox anomaly monitoring.
- Known CVE examples for common products on this port: CVE-2019-15846, CVE-2023-42115. Validate against the actual product and version.
- External vulnerability sources: NVD CVE lookup; CISA KEV exploited-CVE catalog; Exploit-DB public exploit search.

Port 995 - POP3S

- Requesting countries in feed: United States Germany Bulgaria United Kingdom China Japan France Netherlands Portugal Australia.
- Mail services are probed for open relay, credential stuffing, mailbox exposure, and outdated TLS or server software.
- Enforce modern TLS, strong auth, relay restrictions, rate limits, and mailbox anomaly monitoring.
- Known CVE examples for common products on this port: CVE-2019-15846, CVE-2023-42115. Validate against the actual product and version.
- External vulnerability sources: NVD CVE lookup; CISA KEV exploited-CVE catalog; Exploit-DB public exploit search.

Port 1080 - SOCKS proxy

- Requesting countries in feed: United States Poland Singapore United Kingdom Romania Bulgaria France Netherlands China Germany.
- Open proxies are abused for anonymized attacks, relay traffic, credential capture, and access to internal resources.
- Require authentication, block public relay behavior, and verify proxy rules cannot reach private admin networks.
- Known CVE examples for common products on this port: CVE-2021-28651, CVE-2023-46847. Validate against the actual product and version.
- External vulnerability sources: NVD CVE lookup; CISA KEV exploited-CVE catalog; Exploit-DB public exploit search; OWASP web risk categories.

Port 1111 - web/API or admin service

- Requesting countries in feed: United States Iran, Islamic Republic of Bulgaria Romania Germany United Kingdom Netherlands Brazil Mexico Seychelles.
- Web and admin interfaces are common paths for authentication bypass, RCE, file upload, SSRF, and exposed panels.
- Patch frameworks and appliances, remove default credentials, enforce TLS and MFA, and place admin paths behind VPN or allowlists.
- Known CVE examples for common products on this port: CVE-2025-24813, CVE-2024-3400, CVE-2023-3519, CVE-2021-41773. Validate against the actual product and version.
- External vulnerability sources: NVD CVE lookup; CISA KEV exploited-CVE catalog; Exploit-DB public exploit search; OWASP web risk categories.

Port 1194 - OpenVPN

- Requesting countries in feed: United States Singapore China Bulgaria Hong Kong Germany Taiwan United Kingdom France Australia.
- VPN endpoints are targeted for credential attacks, weak legacy protocols, exposed portals, and appliance CVEs.
- Use supported protocols, MFA, rapid patching, source-aware monitoring, and lock out repeated failures.
- Known CVE examples: no reliable generic CVE mapping for this port alone; use the NVD and CISA lookups below with the confirmed product and version.
- External vulnerability sources: NVD CVE lookup; CISA KEV exploited-CVE catalog; Exploit-DB public exploit search.

Port 1433 - Microsoft SQL Server

- Requesting countries in feed: United States China India Iran, Islamic Republic of Australia Mexico Russian Federation Sri Lanka Pakistan Egypt.
- Databases exposed to the Internet risk credential attacks, unauthenticated access, data theft, ransomware, and destructive writes.
- Bind to private interfaces, require strong authentication and TLS, patch engines, and monitor for unexpected queries or dumps.
- Known CVE examples for common products on this port: CVE-2020-0618. Validate against the actual product and version.
- External vulnerability sources: NVD CVE lookup; CISA KEV exploited-CVE catalog; Exploit-DB public exploit search.

Port 1434 - SQL Server browser

- Requesting countries in feed: United States Iran, Islamic Republic of France China Finland Portugal Netherlands Brazil Germany United Kingdom.
- Observed scanning suggests attackers are testing for exposed services, product-specific backdoors, weak credentials, or stale software.
- Identify the listener, confirm business need, patch the owning system, and restrict public access with deny-by-default rules.
- Known CVE examples: no reliable generic CVE mapping for this port alone; use the NVD and CISA lookups below with the confirmed product and version.
- External vulnerability sources: NVD CVE lookup; CISA KEV exploited-CVE catalog; Exploit-DB public exploit search.

Port 1521 - Oracle database listener

- Requesting countries in feed: United States United Kingdom France Taiwan Hong Kong China Germany Australia Bulgaria Belgium.
- Databases exposed to the Internet risk credential attacks, unauthenticated access, data theft, ransomware, and destructive writes.
- Bind to private interfaces, require strong authentication and TLS, patch engines, and monitor for unexpected queries or dumps.
- Known CVE examples: no reliable generic CVE mapping for this port alone; use the NVD and CISA lookups below with the confirmed product and version.
- External vulnerability sources: NVD CVE lookup; CISA KEV exploited-CVE catalog; Exploit-DB public exploit search.

Port 1723 - PPTP VPN

- Requesting countries in feed: United States Germany Singapore Bulgaria United Kingdom China Taiwan Australia France Hong Kong.
- VPN endpoints are targeted for credential attacks, weak legacy protocols, exposed portals, and appliance CVEs.
- Use supported protocols, MFA, rapid patching, source-aware monitoring, and lock out repeated failures.
- Known CVE examples for common products on this port: CVE-2023-27997, CVE-2024-21762. Validate against the actual product and version.
- External vulnerability sources: NVD CVE lookup; CISA KEV exploited-CVE catalog; Exploit-DB public exploit search.

Port 1883 - MQTT

- Requesting countries in feed: United States China United Kingdom France Bulgaria Australia Canada Hong Kong Netherlands Taiwan.
- Message brokers are targeted for anonymous access, weak credentials, unsafe deserialization, and data exfiltration.
- Disable anonymous clients, require TLS and auth, patch broker software, and restrict management consoles.
- Known CVE examples for common products on this port: CVE-2017-7650. Validate against the actual product and version.
- External vulnerability sources: NVD CVE lookup; CISA KEV exploited-CVE catalog; Exploit-DB public exploit search.

Port 1900 - SSDP/UPnP

- Requesting countries in feed: United States Iran, Islamic Republic of Romania France Russian Federation China Germany United Kingdom Hong Kong Taiwan.
- UDP-oriented services can leak information or be abused for reflection, amplification, and device discovery.
- Disable public recursion/discovery, restrict management communities, patch firmware, and filter unsolicited traffic.
- Known CVE examples: no reliable generic CVE mapping for this port alone; use the NVD and CISA lookups below with the confirmed product and version.
- External vulnerability sources: NVD CVE lookup; CISA KEV exploited-CVE catalog; Exploit-DB public exploit search.

Port 2000 - Cisco SCCP or remote admin

- Requesting countries in feed: United States United Kingdom Hong Kong China France Bulgaria Germany Japan Malaysia India.
- Observed scanning suggests attackers are testing for exposed services, product-specific backdoors, weak credentials, or stale software.
- Identify the listener, confirm business need, patch the owning system, and restrict public access with deny-by-default rules.
- Known CVE examples for common products on this port: CVE-2025-24813, CVE-2024-3400, CVE-2023-3519, CVE-2021-41773. Validate against the actual product and version.
- External vulnerability sources: NVD CVE lookup; CISA KEV exploited-CVE catalog; Exploit-DB public exploit search; OWASP web risk categories.

Port 2049 - NFS

- Requesting countries in feed: United States United Kingdom China Switzerland Australia Brazil Netherlands Romania Singapore Bulgaria.
- Observed scanning suggests attackers are testing for exposed services, product-specific backdoors, weak credentials, or stale software.
- Identify the listener, confirm business need, patch the owning system, and restrict public access with deny-by-default rules.
- Known CVE examples for common products on this port: CVE-2017-8779. Validate against the actual product and version.
- External vulnerability sources: NVD CVE lookup; CISA KEV exploited-CVE catalog; Exploit-DB public exploit search.

Port 2082 - cPanel

- Requesting countries in feed: United States Singapore Bulgaria China Hong Kong Germany United Kingdom Portugal India Belgium.
- Observed scanning suggests attackers are testing for exposed services, product-specific backdoors, weak credentials, or stale software.
- Identify the listener, confirm business need, patch the owning system, and restrict public access with deny-by-default rules.
- Known CVE examples: no reliable generic CVE mapping for this port alone; use the NVD and CISA lookups below with the confirmed product and version.
- External vulnerability sources: NVD CVE lookup; CISA KEV exploited-CVE catalog; Exploit-DB public exploit search.

Port 2087 - WHM/cPanel

- Requesting countries in feed: United States Pakistan India Bulgaria China France United Kingdom Germany Taiwan Brazil.
- Observed scanning suggests attackers are testing for exposed services, product-specific backdoors, weak credentials, or stale software.
- Identify the listener, confirm business need, patch the owning system, and restrict public access with deny-by-default rules.
- Known CVE examples: no reliable generic CVE mapping for this port alone; use the NVD and CISA lookups below with the confirmed product and version.
- External vulnerability sources: NVD CVE lookup; CISA KEV exploited-CVE catalog; Exploit-DB public exploit search.

Port 2222 - alternate SSH / admin panel

- Requesting countries in feed: United States China Netherlands Singapore Australia Kazakhstan Germany Russian Federation Bulgaria Poland.
- Observed scanning suggests attackers are testing for exposed services, product-specific backdoors, weak credentials, or stale software.
- Identify the listener, confirm business need, patch the owning system, and restrict public access with deny-by-default rules.
- Known CVE examples for common products on this port: CVE-2025-24813, CVE-2024-3400, CVE-2023-3519, CVE-2021-41773. Validate against the actual product and version.
- External vulnerability sources: NVD CVE lookup; CISA KEV exploited-CVE catalog; Exploit-DB public exploit search; OWASP web risk categories.

Port 2375 - Docker API

- Requesting countries in feed: United States China Pakistan United Kingdom Germany Singapore France Japan Poland Hong Kong.
- Container orchestration APIs can expose secrets, workloads, host mounts, and cluster control if misconfigured.
- Require mutual TLS or strong auth, private network binding, RBAC review, and audit logging for administrative calls.
- Known CVE examples for common products on this port: CVE-2019-5736, CVE-2024-21626. Validate against the actual product and version.
- External vulnerability sources: NVD CVE lookup; CISA KEV exploited-CVE catalog; Exploit-DB public exploit search; OWASP web risk categories.

Port 2376 - Docker API TLS

- Requesting countries in feed: United States Pakistan China Hong Kong Netherlands Germany France United Kingdom Bulgaria Australia.
- Container orchestration APIs can expose secrets, workloads, host mounts, and cluster control if misconfigured.
- Require mutual TLS or strong auth, private network binding, RBAC review, and audit logging for administrative calls.
- Known CVE examples for common products on this port: CVE-2019-5736, CVE-2024-21626. Validate against the actual product and version.
- External vulnerability sources: NVD CVE lookup; CISA KEV exploited-CVE catalog; Exploit-DB public exploit search; OWASP web risk categories.

Port 3000 - development web service

- Requesting countries in feed: United States United Kingdom New Zealand Australia France Netherlands Bulgaria Germany Taiwan China.
- Web and admin interfaces are common paths for authentication bypass, RCE, file upload, SSRF, and exposed panels.
- Patch frameworks and appliances, remove default credentials, enforce TLS and MFA, and place admin paths behind VPN or allowlists.
- Known CVE examples for common products on this port: CVE-2025-24813, CVE-2024-3400, CVE-2023-3519, CVE-2021-41773. Validate against the actual product and version.
- External vulnerability sources: NVD CVE lookup; CISA KEV exploited-CVE catalog; Exploit-DB public exploit search; OWASP web risk categories.

Port 3001 - development web service

- Requesting countries in feed: United States United Kingdom France Netherlands New Zealand Bulgaria China Pakistan Germany Portugal.
- Web and admin interfaces are common paths for authentication bypass, RCE, file upload, SSRF, and exposed panels.
- Patch frameworks and appliances, remove default credentials, enforce TLS and MFA, and place admin paths behind VPN or allowlists.
- Known CVE examples for common products on this port: CVE-2025-24813, CVE-2024-3400, CVE-2023-3519, CVE-2021-41773. Validate against the actual product and version.
- External vulnerability sources: NVD CVE lookup; CISA KEV exploited-CVE catalog; Exploit-DB public exploit search; OWASP web risk categories.

Port 3128 - HTTP proxy

- Requesting countries in feed: United States Poland Singapore France Germany Bulgaria Pakistan United Kingdom China Romania.
- Web and admin interfaces are common paths for authentication bypass, RCE, file upload, SSRF, and exposed panels.
- Patch frameworks and appliances, remove default credentials, enforce TLS and MFA, and place admin paths behind VPN or allowlists.
- Known CVE examples for common products on this port: CVE-2025-24813, CVE-2024-3400, CVE-2023-3519, CVE-2021-41773. Validate against the actual product and version.
- External vulnerability sources: NVD CVE lookup; CISA KEV exploited-CVE catalog; Exploit-DB public exploit search; OWASP web risk categories.

Port 3306 - MySQL/MariaDB

- Requesting countries in feed: United States Netherlands United Kingdom Australia China Bulgaria Japan Belgium France Taiwan.
- Databases exposed to the Internet risk credential attacks, unauthenticated access, data theft, ransomware, and destructive writes.
- Bind to private interfaces, require strong authentication and TLS, patch engines, and monitor for unexpected queries or dumps.
- Known CVE examples for common products on this port: CVE-2012-2122, CVE-2021-2307. Validate against the actual product and version.
- External vulnerability sources: NVD CVE lookup; CISA KEV exploited-CVE catalog; Exploit-DB public exploit search.

Port 3389 - Remote Desktop Protocol

- Requesting countries in feed: United States Romania Bulgaria Cote d'Ivoire Netherlands Vietnam Belgium United Kingdom Germany China.
- Windows remote access surfaces are heavily scanned for weak credentials, lateral-movement services, and historical RCE classes.
- Keep off the public Internet where possible; require VPN, NLA/MFA, current patches, and strict firewall source controls.
- Known CVE examples for common products on this port: CVE-2019-0708, CVE-2019-1181. Validate against the actual product and version.
- External vulnerability sources: NVD CVE lookup; CISA KEV exploited-CVE catalog; Exploit-DB public exploit search.

Port 3702 - WS-Discovery

- Requesting countries in feed: United States Iran, Islamic Republic of Romania China France United Kingdom Lithuania Australia Portugal Bulgaria.
- Observed scanning suggests attackers are testing for exposed services, product-specific backdoors, weak credentials, or stale software.
- Identify the listener, confirm business need, patch the owning system, and restrict public access with deny-by-default rules.
- Known CVE examples: no reliable generic CVE mapping for this port alone; use the NVD and CISA lookups below with the confirmed product and version.
- External vulnerability sources: NVD CVE lookup; CISA KEV exploited-CVE catalog; Exploit-DB public exploit search.

Port 4000 - application service

- Requesting countries in feed: United States China Netherlands France Bulgaria United Kingdom Brazil Finland Germany Hong Kong.
- Observed scanning suggests attackers are testing for exposed services, product-specific backdoors, weak credentials, or stale software.
- Identify the listener, confirm business need, patch the owning system, and restrict public access with deny-by-default rules.
- Known CVE examples: no reliable generic CVE mapping for this port alone; use the NVD and CISA lookups below with the confirmed product and version.
- External vulnerability sources: NVD CVE lookup; CISA KEV exploited-CVE catalog; Exploit-DB public exploit search.

Port 4433 - alternate HTTPS

- Requesting countries in feed: United States Bulgaria Germany Hong Kong China United Kingdom France Australia Netherlands Portugal.
- Web and admin interfaces are common paths for authentication bypass, RCE, file upload, SSRF, and exposed panels.
- Patch frameworks and appliances, remove default credentials, enforce TLS and MFA, and place admin paths behind VPN or allowlists.
- Known CVE examples for common products on this port: CVE-2025-24813, CVE-2024-3400, CVE-2023-3519, CVE-2021-41773. Validate against the actual product and version.
- External vulnerability sources: NVD CVE lookup; CISA KEV exploited-CVE catalog; Exploit-DB public exploit search; OWASP web risk categories.

Port 4443 - alternate HTTPS

- Requesting countries in feed: United States Australia Bulgaria Germany Netherlands United Kingdom China Hong Kong Portugal Taiwan.
- Web and admin interfaces are common paths for authentication bypass, RCE, file upload, SSRF, and exposed panels.
- Patch frameworks and appliances, remove default credentials, enforce TLS and MFA, and place admin paths behind VPN or allowlists.
- Known CVE examples for common products on this port: CVE-2025-24813, CVE-2024-3400, CVE-2023-3519, CVE-2021-41773. Validate against the actual product and version.
- External vulnerability sources: NVD CVE lookup; CISA KEV exploited-CVE catalog; Exploit-DB public exploit search; OWASP web risk categories.

Port 4444 - remote shell/admin service

- Requesting countries in feed: United States United Kingdom Bulgaria Germany China Netherlands Norway Hong Kong India France.
- Observed scanning suggests attackers are testing for exposed services, product-specific backdoors, weak credentials, or stale software.
- Identify the listener, confirm business need, patch the owning system, and restrict public access with deny-by-default rules.
- Known CVE examples for common products on this port: CVE-2025-24813, CVE-2024-3400, CVE-2023-3519, CVE-2021-41773. Validate against the actual product and version.
- External vulnerability sources: NVD CVE lookup; CISA KEV exploited-CVE catalog; Exploit-DB public exploit search; OWASP web risk categories.

Port 4786 - Cisco Smart Install

- Requesting countries in feed: United States France Russian Federation Taiwan China Bulgaria Hong Kong Portugal Romania.
- Industrial, router, and IoT management services often expose unauthenticated commands, default passwords, and old firmware.
- Do not expose directly; segment networks, update firmware, disable unused management APIs, and allowlist operators.
- Known CVE examples for common products on this port: CVE-2018-0171. Validate against the actual product and version.
- External vulnerability sources: NVD CVE lookup; CISA KEV exploited-CVE catalog; Exploit-DB public exploit search.

Port 5000 - HTTP/API service

- Requesting countries in feed: United States Australia Iran, Islamic Republic of Bulgaria China Netherlands United Kingdom Korea, Republic of France Taiwan.
- Web and admin interfaces are common paths for authentication bypass, RCE, file upload, SSRF, and exposed panels.
- Patch frameworks and appliances, remove default credentials, enforce TLS and MFA, and place admin paths behind VPN or allowlists.
- Known CVE examples for common products on this port: CVE-2025-24813, CVE-2024-3400, CVE-2023-3519, CVE-2021-41773. Validate against the actual product and version.
- External vulnerability sources: NVD CVE lookup; CISA KEV exploited-CVE catalog; Exploit-DB public exploit search; OWASP web risk categories.

Port 5001 - HTTP/API service

- Requesting countries in feed: United States Bulgaria China Netherlands France Korea, Republic of Taiwan United Kingdom India Japan.
- Web and admin interfaces are common paths for authentication bypass, RCE, file upload, SSRF, and exposed panels.
- Patch frameworks and appliances, remove default credentials, enforce TLS and MFA, and place admin paths behind VPN or allowlists.
- Known CVE examples for common products on this port: CVE-2025-24813, CVE-2024-3400, CVE-2023-3519, CVE-2021-41773. Validate against the actual product and version.
- External vulnerability sources: NVD CVE lookup; CISA KEV exploited-CVE catalog; Exploit-DB public exploit search; OWASP web risk categories.

Port 5021 - FTP/control variant

- Requesting countries in feed: United States Hong Kong Germany Bulgaria Seychelles.
- FTP-family services are targeted for cleartext credentials, anonymous login, brute force, and vulnerable server builds.
- Prefer SFTP/SSH, disable anonymous access, enforce TLS where retained, and restrict writable directories.
- Known CVE examples: no reliable generic CVE mapping for this port alone; use the NVD and CISA lookups below with the confirmed product and version.
- External vulnerability sources: NVD CVE lookup; CISA KEV exploited-CVE catalog; Exploit-DB public exploit search.

Port 5060 - SIP

- Requesting countries in feed: United States Canada Bulgaria South Africa France Germany United Kingdom Hong Kong India Netherlands.
- Observed scanning suggests attackers are testing for exposed services, product-specific backdoors, weak credentials, or stale software.
- Identify the listener, confirm business need, patch the owning system, and restrict public access with deny-by-default rules.
- Known CVE examples for common products on this port: CVE-2021-32558, CVE-2023-37457. Validate against the actual product and version.
- External vulnerability sources: NVD CVE lookup; CISA KEV exploited-CVE catalog; Exploit-DB public exploit search.

Port 5122 - application service

- Requesting countries in feed: Nigeria Bulgaria United States United Kingdom Austria Netherlands Iran, Islamic Republic of Canada Ukraine China.
- Observed scanning suggests attackers are testing for exposed services, product-specific backdoors, weak credentials, or stale software.
- Identify the listener, confirm business need, patch the owning system, and restrict public access with deny-by-default rules.
- Known CVE examples: no reliable generic CVE mapping for this port alone; use the NVD and CISA lookups below with the confirmed product and version.
- External vulnerability sources: NVD CVE lookup; CISA KEV exploited-CVE catalog; Exploit-DB public exploit search.

Port 5353 - mDNS

- Requesting countries in feed: United States France China Taiwan United Kingdom Bulgaria Germany Netherlands Brazil Singapore.
- UDP-oriented services can leak information or be abused for reflection, amplification, and device discovery.
- Disable public recursion/discovery, restrict management communities, patch firmware, and filter unsolicited traffic.
- Known CVE examples: no reliable generic CVE mapping for this port alone; use the NVD and CISA lookups below with the confirmed product and version.
- External vulnerability sources: NVD CVE lookup; CISA KEV exploited-CVE catalog; Exploit-DB public exploit search.

Port 5432 - PostgreSQL

- Requesting countries in feed: United States Bulgaria United Kingdom Australia Belgium Singapore China France Hong Kong India.
- Databases exposed to the Internet risk credential attacks, unauthenticated access, data theft, ransomware, and destructive writes.
- Bind to private interfaces, require strong authentication and TLS, patch engines, and monitor for unexpected queries or dumps.
- Known CVE examples for common products on this port: CVE-2018-1058, CVE-2024-4317. Validate against the actual product and version.
- External vulnerability sources: NVD CVE lookup; CISA KEV exploited-CVE catalog; Exploit-DB public exploit search.

Port 5555 - Android Debug Bridge / remote admin

- Requesting countries in feed: Ukraine United States Canada China Netherlands Germany Bulgaria Vietnam United Kingdom Korea, Republic of.
- Observed scanning suggests attackers are testing for exposed services, product-specific backdoors, weak credentials, or stale software.
- Identify the listener, confirm business need, patch the owning system, and restrict public access with deny-by-default rules.
- Known CVE examples for common products on this port: CVE-2025-24813, CVE-2024-3400, CVE-2023-3519, CVE-2021-41773. Validate against the actual product and version.
- External vulnerability sources: NVD CVE lookup; CISA KEV exploited-CVE catalog; Exploit-DB public exploit search; OWASP web risk categories.

Port 5672 - AMQP/RabbitMQ

- Requesting countries in feed: United States France China Portugal United Kingdom Australia Hong Kong Belgium Bulgaria Germany.
- Message brokers are targeted for anonymous access, weak credentials, unsafe deserialization, and data exfiltration.
- Disable anonymous clients, require TLS and auth, patch broker software, and restrict management consoles.
- Known CVE examples for common products on this port: CVE-2022-31008. Validate against the actual product and version.
- External vulnerability sources: NVD CVE lookup; CISA KEV exploited-CVE catalog; Exploit-DB public exploit search.

Port 5683 - CoAP

- Requesting countries in feed: United States Iran, Islamic Republic of Hong Kong France Germany Russian Federation China United Kingdom Japan Portugal.
- UDP-oriented services can leak information or be abused for reflection, amplification, and device discovery.
- Disable public recursion/discovery, restrict management communities, patch firmware, and filter unsolicited traffic.
- Known CVE examples: no reliable generic CVE mapping for this port alone; use the NVD and CISA lookups below with the confirmed product and version.
- External vulnerability sources: NVD CVE lookup; CISA KEV exploited-CVE catalog; Exploit-DB public exploit search.

Port 5900 - VNC

- Requesting countries in feed: United States Singapore Bulgaria Hong Kong Pakistan Germany Canada Netherlands Korea, Republic of Estonia.
- VNC commonly suffers from weak passwords, no MFA, and exposed graphical sessions that enable direct host takeover.
- Block public access, tunnel through VPN/SSH, enforce strong authentication, and verify encryption is enabled.
- Known CVE examples for common products on this port: CVE-2019-15681, CVE-2020-14405. Validate against the actual product and version.
- External vulnerability sources: NVD CVE lookup; CISA KEV exploited-CVE catalog; Exploit-DB public exploit search.

Port 5901 - VNC

- Requesting countries in feed: United States China Germany Netherlands Pakistan United Kingdom Hong Kong Iran, Islamic Republic of Taiwan Australia.
- VNC commonly suffers from weak passwords, no MFA, and exposed graphical sessions that enable direct host takeover.
- Block public access, tunnel through VPN/SSH, enforce strong authentication, and verify encryption is enabled.
- Known CVE examples for common products on this port: CVE-2019-15681, CVE-2020-14405. Validate against the actual product and version.
- External vulnerability sources: NVD CVE lookup; CISA KEV exploited-CVE catalog; Exploit-DB public exploit search.

Port 5902 - VNC

- Requesting countries in feed: United States Netherlands Hong Kong Germany Taiwan Iran, Islamic Republic of Mexico Bulgaria Korea, Republic of United Kingdom.
- VNC commonly suffers from weak passwords, no MFA, and exposed graphical sessions that enable direct host takeover.
- Block public access, tunnel through VPN/SSH, enforce strong authentication, and verify encryption is enabled.
- Known CVE examples for common products on this port: CVE-2019-15681, CVE-2020-14405. Validate against the actual product and version.
- External vulnerability sources: NVD CVE lookup; CISA KEV exploited-CVE catalog; Exploit-DB public exploit search.

Port 5903 - VNC

- Requesting countries in feed: United States Hong Kong Taiwan United Kingdom Netherlands France Bulgaria China Germany Malaysia.
- VNC commonly suffers from weak passwords, no MFA, and exposed graphical sessions that enable direct host takeover.
- Block public access, tunnel through VPN/SSH, enforce strong authentication, and verify encryption is enabled.
- Known CVE examples for common products on this port: CVE-2019-15681, CVE-2020-14405. Validate against the actual product and version.
- External vulnerability sources: NVD CVE lookup; CISA KEV exploited-CVE catalog; Exploit-DB public exploit search.

Port 5984 - CouchDB

- Requesting countries in feed: United States China Germany Portugal Bulgaria Switzerland Australia France Netherlands Seychelles.
- Observed scanning suggests attackers are testing for exposed services, product-specific backdoors, weak credentials, or stale software.
- Identify the listener, confirm business need, patch the owning system, and restrict public access with deny-by-default rules.
- Known CVE examples for common products on this port: CVE-2017-12635, CVE-2022-24706. Validate against the actual product and version.
- External vulnerability sources: NVD CVE lookup; CISA KEV exploited-CVE catalog; Exploit-DB public exploit search.

Port 5985 - WinRM HTTP

- Requesting countries in feed: United States Australia Netherlands China Bulgaria United Kingdom France Germany India Taiwan.
- Web and admin interfaces are common paths for authentication bypass, RCE, file upload, SSRF, and exposed panels.
- Patch frameworks and appliances, remove default credentials, enforce TLS and MFA, and place admin paths behind VPN or allowlists.
- Known CVE examples for common products on this port: CVE-2021-31166, CVE-2020-0618. Validate against the actual product and version.
- External vulnerability sources: NVD CVE lookup; CISA KEV exploited-CVE catalog; Exploit-DB public exploit search; OWASP web risk categories.

Port 5986 - WinRM HTTPS

- Requesting countries in feed: United States Australia Germany France Taiwan Netherlands China Belgium Bulgaria Canada.
- Web and admin interfaces are common paths for authentication bypass, RCE, file upload, SSRF, and exposed panels.
- Patch frameworks and appliances, remove default credentials, enforce TLS and MFA, and place admin paths behind VPN or allowlists.
- Known CVE examples for common products on this port: CVE-2021-31166, CVE-2020-0618. Validate against the actual product and version.
- External vulnerability sources: NVD CVE lookup; CISA KEV exploited-CVE catalog; Exploit-DB public exploit search; OWASP web risk categories.

Port 6021 - FTP/control variant

- Requesting countries in feed: United States Hong Kong Germany Netherlands United Kingdom.
- FTP-family services are targeted for cleartext credentials, anonymous login, brute force, and vulnerable server builds.
- Prefer SFTP/SSH, disable anonymous access, enforce TLS where retained, and restrict writable directories.
- Known CVE examples: no reliable generic CVE mapping for this port alone; use the NVD and CISA lookups below with the confirmed product and version.
- External vulnerability sources: NVD CVE lookup; CISA KEV exploited-CVE catalog; Exploit-DB public exploit search.

Port 6080 - web console/proxy

- Requesting countries in feed: United States Hong Kong Germany United Kingdom China Bulgaria India Iran, Islamic Republic of Malaysia France.
- Web and admin interfaces are common paths for authentication bypass, RCE, file upload, SSRF, and exposed panels.
- Patch frameworks and appliances, remove default credentials, enforce TLS and MFA, and place admin paths behind VPN or allowlists.
- Known CVE examples for common products on this port: CVE-2025-24813, CVE-2024-3400, CVE-2023-3519, CVE-2021-41773. Validate against the actual product and version.
- External vulnerability sources: NVD CVE lookup; CISA KEV exploited-CVE catalog; Exploit-DB public exploit search; OWASP web risk categories.

Port 6379 - Redis

- Requesting countries in feed: China United States Taiwan Australia Belgium Singapore Germany United Kingdom Netherlands Bulgaria.
- Databases exposed to the Internet risk credential attacks, unauthenticated access, data theft, ransomware, and destructive writes.
- Bind to private interfaces, require strong authentication and TLS, patch engines, and monitor for unexpected queries or dumps.
- Known CVE examples for common products on this port: CVE-2022-0543, CVE-2023-28856. Validate against the actual product and version.
- External vulnerability sources: NVD CVE lookup; CISA KEV exploited-CVE catalog; Exploit-DB public exploit search.

Port 6443 - Kubernetes API

- Requesting countries in feed: United States Australia Bulgaria Hong Kong China Netherlands Germany United Kingdom Portugal France.
- Container orchestration APIs can expose secrets, workloads, host mounts, and cluster control if misconfigured.
- Require mutual TLS or strong auth, private network binding, RBAC review, and audit logging for administrative calls.
- Known CVE examples for common products on this port: CVE-2018-1002105, CVE-2020-8554. Validate against the actual product and version.
- External vulnerability sources: NVD CVE lookup; CISA KEV exploited-CVE catalog; Exploit-DB public exploit search; OWASP web risk categories.

Port 6502 - application service

- Requesting countries in feed: United States Hong Kong Germany China Netherlands.
- Observed scanning suggests attackers are testing for exposed services, product-specific backdoors, weak credentials, or stale software.
- Identify the listener, confirm business need, patch the owning system, and restrict public access with deny-by-default rules.
- Known CVE examples: no reliable generic CVE mapping for this port alone; use the NVD and CISA lookups below with the confirmed product and version.
- External vulnerability sources: NVD CVE lookup; CISA KEV exploited-CVE catalog; Exploit-DB public exploit search.

Port 6590 - application service

- Requesting countries in feed: United States Hong Kong Germany China Bulgaria Netherlands.
- Observed scanning suggests attackers are testing for exposed services, product-specific backdoors, weak credentials, or stale software.
- Identify the listener, confirm business need, patch the owning system, and restrict public access with deny-by-default rules.
- Known CVE examples: no reliable generic CVE mapping for this port alone; use the NVD and CISA lookups below with the confirmed product and version.
- External vulnerability sources: NVD CVE lookup; CISA KEV exploited-CVE catalog; Exploit-DB public exploit search.

Port 7000 - web/API service

- Requesting countries in feed: United States Australia Bulgaria China Netherlands United Kingdom India Germany Norway Spain.
- Web and admin interfaces are common paths for authentication bypass, RCE, file upload, SSRF, and exposed panels.
- Patch frameworks and appliances, remove default credentials, enforce TLS and MFA, and place admin paths behind VPN or allowlists.
- Known CVE examples for common products on this port: CVE-2025-24813, CVE-2024-3400, CVE-2023-3519, CVE-2021-41773. Validate against the actual product and version.
- External vulnerability sources: NVD CVE lookup; CISA KEV exploited-CVE catalog; Exploit-DB public exploit search; OWASP web risk categories.

Port 7001 - Oracle WebLogic

- Requesting countries in feed: United States Australia Hong Kong Bulgaria China Germany United Kingdom France Netherlands Spain.
- Web and admin interfaces are common paths for authentication bypass, RCE, file upload, SSRF, and exposed panels.
- Patch frameworks and appliances, remove default credentials, enforce TLS and MFA, and place admin paths behind VPN or allowlists.
- Known CVE examples for common products on this port: CVE-2020-14882, CVE-2019-2725. Validate against the actual product and version.
- External vulnerability sources: NVD CVE lookup; CISA KEV exploited-CVE catalog; Exploit-DB public exploit search; OWASP web risk categories.

Port 7443 - alternate HTTPS/admin

- Requesting countries in feed: United States Australia Bulgaria China Taiwan Netherlands United Kingdom Germany Hong Kong France.
- Web and admin interfaces are common paths for authentication bypass, RCE, file upload, SSRF, and exposed panels.
- Patch frameworks and appliances, remove default credentials, enforce TLS and MFA, and place admin paths behind VPN or allowlists.
- Known CVE examples for common products on this port: CVE-2025-24813, CVE-2024-3400, CVE-2023-3519, CVE-2021-41773. Validate against the actual product and version.
- External vulnerability sources: NVD CVE lookup; CISA KEV exploited-CVE catalog; Exploit-DB public exploit search; OWASP web risk categories.

Port 7547 - TR-069/CWMP

- Requesting countries in feed: United States United Kingdom Bulgaria France Netherlands China Germany India Australia Hong Kong.
- Industrial, router, and IoT management services often expose unauthenticated commands, default passwords, and old firmware.
- Do not expose directly; segment networks, update firmware, disable unused management APIs, and allowlist operators.
- Known CVE examples for common products on this port: CVE-2017-17215, CVE-2014-9222. Validate against the actual product and version.
- External vulnerability sources: NVD CVE lookup; CISA KEV exploited-CVE catalog; Exploit-DB public exploit search.

Port 7777 - application/game/admin service

- Requesting countries in feed: United States Netherlands Iran, Islamic Republic of Bulgaria France Singapore Germany China United Kingdom Japan.
- Observed scanning suggests attackers are testing for exposed services, product-specific backdoors, weak credentials, or stale software.
- Identify the listener, confirm business need, patch the owning system, and restrict public access with deny-by-default rules.
- Known CVE examples for common products on this port: CVE-2025-24813, CVE-2024-3400, CVE-2023-3519, CVE-2021-41773. Validate against the actual product and version.
- External vulnerability sources: NVD CVE lookup; CISA KEV exploited-CVE catalog; Exploit-DB public exploit search; OWASP web risk categories.

Port 8000 - HTTP alternate

- Requesting countries in feed: United States Germany Australia United Kingdom Iran, Islamic Republic of China France Bulgaria Hong Kong Japan.
- Web and admin interfaces are common paths for authentication bypass, RCE, file upload, SSRF, and exposed panels.
- Patch frameworks and appliances, remove default credentials, enforce TLS and MFA, and place admin paths behind VPN or allowlists.
- Known CVE examples for common products on this port: CVE-2025-24813, CVE-2024-3400, CVE-2023-3519, CVE-2021-41773. Validate against the actual product and version.
- External vulnerability sources: NVD CVE lookup; CISA KEV exploited-CVE catalog; Exploit-DB public exploit search; OWASP web risk categories.

Port 8001 - HTTP alternate

- Requesting countries in feed: United States Australia China Korea, Republic of Bulgaria Japan United Kingdom Germany Netherlands Spain.
- Web and admin interfaces are common paths for authentication bypass, RCE, file upload, SSRF, and exposed panels.
- Patch frameworks and appliances, remove default credentials, enforce TLS and MFA, and place admin paths behind VPN or allowlists.
- Known CVE examples for common products on this port: CVE-2025-24813, CVE-2024-3400, CVE-2023-3519, CVE-2021-41773. Validate against the actual product and version.
- External vulnerability sources: NVD CVE lookup; CISA KEV exploited-CVE catalog; Exploit-DB public exploit search; OWASP web risk categories.

Port 8008 - HTTP alternate

- Requesting countries in feed: United States Australia Bulgaria Germany China United Kingdom Taiwan Hong Kong India Netherlands.
- Web and admin interfaces are common paths for authentication bypass, RCE, file upload, SSRF, and exposed panels.
- Patch frameworks and appliances, remove default credentials, enforce TLS and MFA, and place admin paths behind VPN or allowlists.
- Known CVE examples for common products on this port: CVE-2025-24813, CVE-2024-3400, CVE-2023-3519, CVE-2021-41773. Validate against the actual product and version.
- External vulnerability sources: NVD CVE lookup; CISA KEV exploited-CVE catalog; Exploit-DB public exploit search; OWASP web risk categories.

Port 8009 - Apache JServ Protocol

- Requesting countries in feed: United States United Kingdom China Germany Netherlands Taiwan Australia Bulgaria France Portugal.
- Observed scanning suggests attackers are testing for exposed services, product-specific backdoors, weak credentials, or stale software.
- Identify the listener, confirm business need, patch the owning system, and restrict public access with deny-by-default rules.
- Known CVE examples for common products on this port: CVE-2020-1938. Validate against the actual product and version.
- External vulnerability sources: NVD CVE lookup; CISA KEV exploited-CVE catalog; Exploit-DB public exploit search.

Port 8080 - HTTP proxy/web admin

- Requesting countries in feed: United States Netherlands Pakistan Germany United Kingdom Hong Kong Iran, Islamic Republic of Spain Australia France.
- Web and admin interfaces are common paths for authentication bypass, RCE, file upload, SSRF, and exposed panels.
- Patch frameworks and appliances, remove default credentials, enforce TLS and MFA, and place admin paths behind VPN or allowlists.
- Known CVE examples for common products on this port: CVE-2025-24813, CVE-2024-3400, CVE-2023-3519, CVE-2021-41773. Validate against the actual product and version.
- External vulnerability sources: NVD CVE lookup; CISA KEV exploited-CVE catalog; Exploit-DB public exploit search; OWASP web risk categories.

Port 8081 - HTTP alternate

- Requesting countries in feed: United States Iran, Islamic Republic of Germany Spain Pakistan Hong Kong France Australia China Bulgaria.
- Web and admin interfaces are common paths for authentication bypass, RCE, file upload, SSRF, and exposed panels.
- Patch frameworks and appliances, remove default credentials, enforce TLS and MFA, and place admin paths behind VPN or allowlists.
- Known CVE examples for common products on this port: CVE-2025-24813, CVE-2024-3400, CVE-2023-3519, CVE-2021-41773. Validate against the actual product and version.
- External vulnerability sources: NVD CVE lookup; CISA KEV exploited-CVE catalog; Exploit-DB public exploit search; OWASP web risk categories.

Port 8082 - HTTP alternate

- Requesting countries in feed: United States Iran, Islamic Republic of Spain Australia Germany Hong Kong China France Romania Bulgaria.
- Web and admin interfaces are common paths for authentication bypass, RCE, file upload, SSRF, and exposed panels.
- Patch frameworks and appliances, remove default credentials, enforce TLS and MFA, and place admin paths behind VPN or allowlists.
- Known CVE examples for common products on this port: CVE-2025-24813, CVE-2024-3400, CVE-2023-3519, CVE-2021-41773. Validate against the actual product and version.
- External vulnerability sources: NVD CVE lookup; CISA KEV exploited-CVE catalog; Exploit-DB public exploit search; OWASP web risk categories.

Port 8083 - HTTP alternate

- Requesting countries in feed: United States Iran, Islamic Republic of Germany China Bulgaria Hong Kong Korea, Republic of Netherlands Brazil France.
- Web and admin interfaces are common paths for authentication bypass, RCE, file upload, SSRF, and exposed panels.
- Patch frameworks and appliances, remove default credentials, enforce TLS and MFA, and place admin paths behind VPN or allowlists.
- Known CVE examples for common products on this port: CVE-2025-24813, CVE-2024-3400, CVE-2023-3519, CVE-2021-41773. Validate against the actual product and version.
- External vulnerability sources: NVD CVE lookup; CISA KEV exploited-CVE catalog; Exploit-DB public exploit search; OWASP web risk categories.

Port 8085 - HTTP alternate

- Requesting countries in feed: United States Iran, Islamic Republic of Germany United Kingdom France Bulgaria Netherlands China Hong Kong Canada.
- Web and admin interfaces are common paths for authentication bypass, RCE, file upload, SSRF, and exposed panels.
- Patch frameworks and appliances, remove default credentials, enforce TLS and MFA, and place admin paths behind VPN or allowlists.
- Known CVE examples for common products on this port: CVE-2025-24813, CVE-2024-3400, CVE-2023-3519, CVE-2021-41773. Validate against the actual product and version.
- External vulnerability sources: NVD CVE lookup; CISA KEV exploited-CVE catalog; Exploit-DB public exploit search; OWASP web risk categories.

Port 8088 - HTTP alternate

- Requesting countries in feed: United States China Australia Germany Bulgaria France Hong Kong Canada Taiwan United Kingdom.
- Web and admin interfaces are common paths for authentication bypass, RCE, file upload, SSRF, and exposed panels.
- Patch frameworks and appliances, remove default credentials, enforce TLS and MFA, and place admin paths behind VPN or allowlists.
- Known CVE examples for common products on this port: CVE-2025-24813, CVE-2024-3400, CVE-2023-3519, CVE-2021-41773. Validate against the actual product and version.
- External vulnerability sources: NVD CVE lookup; CISA KEV exploited-CVE catalog; Exploit-DB public exploit search; OWASP web risk categories.

Port 8090 - HTTP alternate

- Requesting countries in feed: United States Pakistan Iran, Islamic Republic of Germany Bulgaria France China Korea, Republic of Taiwan Malaysia.
- Web and admin interfaces are common paths for authentication bypass, RCE, file upload, SSRF, and exposed panels.
- Patch frameworks and appliances, remove default credentials, enforce TLS and MFA, and place admin paths behind VPN or allowlists.
- Known CVE examples for common products on this port: CVE-2025-24813, CVE-2024-3400, CVE-2023-3519, CVE-2021-41773. Validate against the actual product and version.
- External vulnerability sources: NVD CVE lookup; CISA KEV exploited-CVE catalog; Exploit-DB public exploit search; OWASP web risk categories.

Port 8181 - HTTP alternate

- Requesting countries in feed: United States Iran, Islamic Republic of Bulgaria China Hong Kong Malaysia United Kingdom Germany Japan Australia.
- Web and admin interfaces are common paths for authentication bypass, RCE, file upload, SSRF, and exposed panels.
- Patch frameworks and appliances, remove default credentials, enforce TLS and MFA, and place admin paths behind VPN or allowlists.
- Known CVE examples for common products on this port: CVE-2025-24813, CVE-2024-3400, CVE-2023-3519, CVE-2021-41773. Validate against the actual product and version.
- External vulnerability sources: NVD CVE lookup; CISA KEV exploited-CVE catalog; Exploit-DB public exploit search; OWASP web risk categories.

Port 8291 - MikroTik Winbox

- Requesting countries in feed: United States Australia China India United Kingdom Canada France Netherlands Pakistan Romania.
- Observed scanning suggests attackers are testing for exposed services, product-specific backdoors, weak credentials, or stale software.
- Identify the listener, confirm business need, patch the owning system, and restrict public access with deny-by-default rules.
- Known CVE examples for common products on this port: CVE-2018-14847, CVE-2023-30799. Validate against the actual product and version.
- External vulnerability sources: NVD CVE lookup; CISA KEV exploited-CVE catalog; Exploit-DB public exploit search.

Port 8443 - HTTPS alternate/admin

- Requesting countries in feed: United States Germany Australia United Kingdom Netherlands Hong Kong Iran, Islamic Republic of Bulgaria China Pakistan.
- Web and admin interfaces are common paths for authentication bypass, RCE, file upload, SSRF, and exposed panels.
- Patch frameworks and appliances, remove default credentials, enforce TLS and MFA, and place admin paths behind VPN or allowlists.
- Known CVE examples for common products on this port: CVE-2025-24813, CVE-2024-3400, CVE-2023-3519, CVE-2021-41773. Validate against the actual product and version.
- External vulnerability sources: NVD CVE lookup; CISA KEV exploited-CVE catalog; Exploit-DB public exploit search; OWASP web risk categories.

Port 8728 - MikroTik API

- Requesting countries in feed: Pakistan United States China Netherlands Romania Australia Bulgaria Hong Kong United Kingdom.
- Observed scanning suggests attackers are testing for exposed services, product-specific backdoors, weak credentials, or stale software.
- Identify the listener, confirm business need, patch the owning system, and restrict public access with deny-by-default rules.
- Known CVE examples for common products on this port: CVE-2018-14847, CVE-2023-30799. Validate against the actual product and version.
- External vulnerability sources: NVD CVE lookup; CISA KEV exploited-CVE catalog; Exploit-DB public exploit search; OWASP web risk categories.

Port 8800 - web/admin service

- Requesting countries in feed: United States Australia Iran, Islamic Republic of France Bulgaria China Taiwan Brazil Germany India.
- Web and admin interfaces are common paths for authentication bypass, RCE, file upload, SSRF, and exposed panels.
- Patch frameworks and appliances, remove default credentials, enforce TLS and MFA, and place admin paths behind VPN or allowlists.
- Known CVE examples for common products on this port: CVE-2025-24813, CVE-2024-3400, CVE-2023-3519, CVE-2021-41773. Validate against the actual product and version.
- External vulnerability sources: NVD CVE lookup; CISA KEV exploited-CVE catalog; Exploit-DB public exploit search; OWASP web risk categories.

Port 8880 - HTTP alternate

- Requesting countries in feed: United States Australia France Germany Bulgaria United Kingdom China Hong Kong Netherlands Canada.
- Web and admin interfaces are common paths for authentication bypass, RCE, file upload, SSRF, and exposed panels.
- Patch frameworks and appliances, remove default credentials, enforce TLS and MFA, and place admin paths behind VPN or allowlists.
- Known CVE examples for common products on this port: CVE-2025-24813, CVE-2024-3400, CVE-2023-3519, CVE-2021-41773. Validate against the actual product and version.
- External vulnerability sources: NVD CVE lookup; CISA KEV exploited-CVE catalog; Exploit-DB public exploit search; OWASP web risk categories.

Port 8883 - MQTT over TLS

- Requesting countries in feed: United States France United Kingdom Netherlands Germany Australia Canada Taiwan China Hong Kong.
- Message brokers are targeted for anonymous access, weak credentials, unsafe deserialization, and data exfiltration.
- Disable anonymous clients, require TLS and auth, patch broker software, and restrict management consoles.
- Known CVE examples: no reliable generic CVE mapping for this port alone; use the NVD and CISA lookups below with the confirmed product and version.
- External vulnerability sources: NVD CVE lookup; CISA KEV exploited-CVE catalog; Exploit-DB public exploit search.

Port 8888 - HTTP alternate/proxy

- Requesting countries in feed: United States Pakistan France Australia Iran, Islamic Republic of China Germany Bulgaria Netherlands Taiwan.
- Web and admin interfaces are common paths for authentication bypass, RCE, file upload, SSRF, and exposed panels.
- Patch frameworks and appliances, remove default credentials, enforce TLS and MFA, and place admin paths behind VPN or allowlists.
- Known CVE examples for common products on this port: CVE-2025-24813, CVE-2024-3400, CVE-2023-3519, CVE-2021-41773. Validate against the actual product and version.
- External vulnerability sources: NVD CVE lookup; CISA KEV exploited-CVE catalog; Exploit-DB public exploit search; OWASP web risk categories.

Port 8899 - web/admin service

- Requesting countries in feed: United States Iran, Islamic Republic of France Singapore Bulgaria China United Kingdom Canada Netherlands Germany.
- Web and admin interfaces are common paths for authentication bypass, RCE, file upload, SSRF, and exposed panels.
- Patch frameworks and appliances, remove default credentials, enforce TLS and MFA, and place admin paths behind VPN or allowlists.
- Known CVE examples for common products on this port: CVE-2025-24813, CVE-2024-3400, CVE-2023-3519, CVE-2021-41773. Validate against the actual product and version.
- External vulnerability sources: NVD CVE lookup; CISA KEV exploited-CVE catalog; Exploit-DB public exploit search; OWASP web risk categories.

Port 8900 - web/admin service

- Requesting countries in feed: United States Hong Kong Germany Bulgaria Netherlands United Kingdom.
- Web and admin interfaces are common paths for authentication bypass, RCE, file upload, SSRF, and exposed panels.
- Patch frameworks and appliances, remove default credentials, enforce TLS and MFA, and place admin paths behind VPN or allowlists.
- Known CVE examples for common products on this port: CVE-2025-24813, CVE-2024-3400, CVE-2023-3519, CVE-2021-41773. Validate against the actual product and version.
- External vulnerability sources: NVD CVE lookup; CISA KEV exploited-CVE catalog; Exploit-DB public exploit search; OWASP web risk categories.

Port 9000 - web/API or admin console

- Requesting countries in feed: United States Australia United Kingdom Bulgaria Korea, Republic of Germany Singapore China Netherlands Japan.
- Web and admin interfaces are common paths for authentication bypass, RCE, file upload, SSRF, and exposed panels.
- Patch frameworks and appliances, remove default credentials, enforce TLS and MFA, and place admin paths behind VPN or allowlists.
- Known CVE examples for common products on this port: CVE-2025-24813, CVE-2024-3400, CVE-2023-3519, CVE-2021-41773. Validate against the actual product and version.
- External vulnerability sources: NVD CVE lookup; CISA KEV exploited-CVE catalog; Exploit-DB public exploit search; OWASP web risk categories.

Port 9001 - web/API or Tor ORPort

- Requesting countries in feed: United States France United Kingdom Bulgaria Australia Taiwan China Hong Kong Netherlands Belgium.
- Web and admin interfaces are common paths for authentication bypass, RCE, file upload, SSRF, and exposed panels.
- Patch frameworks and appliances, remove default credentials, enforce TLS and MFA, and place admin paths behind VPN or allowlists.
- Known CVE examples for common products on this port: CVE-2025-24813, CVE-2024-3400, CVE-2023-3519, CVE-2021-41773. Validate against the actual product and version.
- External vulnerability sources: NVD CVE lookup; CISA KEV exploited-CVE catalog; Exploit-DB public exploit search; OWASP web risk categories.

Port 9002 - web/API service

- Requesting countries in feed: United States Bulgaria China France Taiwan United Kingdom Russian Federation Australia Germany Hong Kong.
- Web and admin interfaces are common paths for authentication bypass, RCE, file upload, SSRF, and exposed panels.
- Patch frameworks and appliances, remove default credentials, enforce TLS and MFA, and place admin paths behind VPN or allowlists.
- Known CVE examples for common products on this port: CVE-2025-24813, CVE-2024-3400, CVE-2023-3519, CVE-2021-41773. Validate against the actual product and version.
- External vulnerability sources: NVD CVE lookup; CISA KEV exploited-CVE catalog; Exploit-DB public exploit search; OWASP web risk categories.

Port 9080 - HTTP alternate

- Requesting countries in feed: United States Hong Kong China United Kingdom Bulgaria Germany Japan France Spain Canada.
- Web and admin interfaces are common paths for authentication bypass, RCE, file upload, SSRF, and exposed panels.
- Patch frameworks and appliances, remove default credentials, enforce TLS and MFA, and place admin paths behind VPN or allowlists.
- Known CVE examples for common products on this port: CVE-2025-24813, CVE-2024-3400, CVE-2023-3519, CVE-2021-41773. Validate against the actual product and version.
- External vulnerability sources: NVD CVE lookup; CISA KEV exploited-CVE catalog; Exploit-DB public exploit search; OWASP web risk categories.

Port 9090 - web admin/Prometheus

- Requesting countries in feed: United States Australia Germany Bulgaria Singapore China Hong Kong United Kingdom Lithuania Spain.
- Web and admin interfaces are common paths for authentication bypass, RCE, file upload, SSRF, and exposed panels.
- Patch frameworks and appliances, remove default credentials, enforce TLS and MFA, and place admin paths behind VPN or allowlists.
- Known CVE examples for common products on this port: CVE-2025-24813, CVE-2024-3400, CVE-2023-3519, CVE-2021-41773. Validate against the actual product and version.
- External vulnerability sources: NVD CVE lookup; CISA KEV exploited-CVE catalog; Exploit-DB public exploit search; OWASP web risk categories.

Port 9100 - printer/JetDirect

- Requesting countries in feed: United States Spain China Bulgaria Malaysia Germany Netherlands United Kingdom Greece India.
- Observed scanning suggests attackers are testing for exposed services, product-specific backdoors, weak credentials, or stale software.
- Identify the listener, confirm business need, patch the owning system, and restrict public access with deny-by-default rules.
- Known CVE examples: no reliable generic CVE mapping for this port alone; use the NVD and CISA lookups below with the confirmed product and version.
- External vulnerability sources: NVD CVE lookup; CISA KEV exploited-CVE catalog; Exploit-DB public exploit search.

Port 9200 - Elasticsearch

- Requesting countries in feed: United States Australia Germany United Kingdom India China Bulgaria France Japan Poland.
- Observed scanning suggests attackers are testing for exposed services, product-specific backdoors, weak credentials, or stale software.
- Identify the listener, confirm business need, patch the owning system, and restrict public access with deny-by-default rules.
- Known CVE examples for common products on this port: CVE-2015-1427, CVE-2021-22145. Validate against the actual product and version.
- External vulnerability sources: NVD CVE lookup; CISA KEV exploited-CVE catalog; Exploit-DB public exploit search.

Port 9443 - HTTPS alternate/admin

- Requesting countries in feed: United States Hong Kong Germany Australia China Bulgaria France Japan Taiwan Netherlands.
- Web and admin interfaces are common paths for authentication bypass, RCE, file upload, SSRF, and exposed panels.
- Patch frameworks and appliances, remove default credentials, enforce TLS and MFA, and place admin paths behind VPN or allowlists.
- Known CVE examples for common products on this port: CVE-2025-24813, CVE-2024-3400, CVE-2023-3519, CVE-2021-41773. Validate against the actual product and version.
- External vulnerability sources: NVD CVE lookup; CISA KEV exploited-CVE catalog; Exploit-DB public exploit search; OWASP web risk categories.

Port 9999 - web/admin service

- Requesting countries in feed: United States Bulgaria Germany Hong Kong China Netherlands Norway United Kingdom France Japan.
- Web and admin interfaces are common paths for authentication bypass, RCE, file upload, SSRF, and exposed panels.
- Patch frameworks and appliances, remove default credentials, enforce TLS and MFA, and place admin paths behind VPN or allowlists.
- Known CVE examples for common products on this port: CVE-2025-24813, CVE-2024-3400, CVE-2023-3519, CVE-2021-41773. Validate against the actual product and version.
- External vulnerability sources: NVD CVE lookup; CISA KEV exploited-CVE catalog; Exploit-DB public exploit search; OWASP web risk categories.

Port 10000 - Webmin

- Requesting countries in feed: United States Australia Netherlands Bulgaria China Germany United Kingdom France Taiwan Portugal.
- Web and admin interfaces are common paths for authentication bypass, RCE, file upload, SSRF, and exposed panels.
- Patch frameworks and appliances, remove default credentials, enforce TLS and MFA, and place admin paths behind VPN or allowlists.
- Known CVE examples for common products on this port: CVE-2019-15107, CVE-2022-0824. Validate against the actual product and version.
- External vulnerability sources: NVD CVE lookup; CISA KEV exploited-CVE catalog; Exploit-DB public exploit search; OWASP web risk categories.

Port 10001 - Ubiquiti discovery/IoT admin

- Requesting countries in feed: United States Hong Kong France United Kingdom Germany Taiwan Bulgaria China Netherlands Portugal.
- Industrial, router, and IoT management services often expose unauthenticated commands, default passwords, and old firmware.
- Do not expose directly; segment networks, update firmware, disable unused management APIs, and allowlist operators.
- Known CVE examples for common products on this port: CVE-2025-24813, CVE-2024-3400, CVE-2023-3519, CVE-2021-41773. Validate against the actual product and version.
- External vulnerability sources: NVD CVE lookup; CISA KEV exploited-CVE catalog; Exploit-DB public exploit search; OWASP web risk categories.

Port 10250 - Kubernetes kubelet API

- Requesting countries in feed: United States Australia France Taiwan Germany Netherlands United Kingdom Bulgaria Hong Kong Romania.
- Container orchestration APIs can expose secrets, workloads, host mounts, and cluster control if misconfigured.
- Require mutual TLS or strong auth, private network binding, RBAC review, and audit logging for administrative calls.
- Known CVE examples for common products on this port: CVE-2018-1002105, CVE-2020-8554. Validate against the actual product and version.
- External vulnerability sources: NVD CVE lookup; CISA KEV exploited-CVE catalog; Exploit-DB public exploit search; OWASP web risk categories.

Port 10443 - HTTPS alternate/admin

- Requesting countries in feed: United States Bulgaria Germany United Kingdom China Taiwan Australia Netherlands France India.
- Web and admin interfaces are common paths for authentication bypass, RCE, file upload, SSRF, and exposed panels.
- Patch frameworks and appliances, remove default credentials, enforce TLS and MFA, and place admin paths behind VPN or allowlists.
- Known CVE examples for common products on this port: CVE-2025-24813, CVE-2024-3400, CVE-2023-3519, CVE-2021-41773. Validate against the actual product and version.
- External vulnerability sources: NVD CVE lookup; CISA KEV exploited-CVE catalog; Exploit-DB public exploit search; OWASP web risk categories.

Port 11211 - Memcached

- Requesting countries in feed: United States Australia France China Romania United Kingdom Germany Russian Federation Brazil Hong Kong.
- Observed scanning suggests attackers are testing for exposed services, product-specific backdoors, weak credentials, or stale software.
- Identify the listener, confirm business need, patch the owning system, and restrict public access with deny-by-default rules.
- Known CVE examples for common products on this port: CVE-2018-1000115. Validate against the actual product and version.
- External vulnerability sources: NVD CVE lookup; CISA KEV exploited-CVE catalog; Exploit-DB public exploit search.

Port 11434 - Ollama API

- Requesting countries in feed: United States United Kingdom Australia China India Belgium Canada Germany Netherlands Singapore.
- Observed scanning suggests attackers are testing for exposed services, product-specific backdoors, weak credentials, or stale software.
- Identify the listener, confirm business need, patch the owning system, and restrict public access with deny-by-default rules.
- Known CVE examples for common products on this port: CVE-2024-37032. Validate against the actual product and version.
- External vulnerability sources: NVD CVE lookup; CISA KEV exploited-CVE catalog; Exploit-DB public exploit search; OWASP web risk categories.

Port 17000 - application service

- Requesting countries in feed: Ukraine United States Spain United Kingdom Netherlands Belgium Bangladesh Lebanon South Africa Germany.
- Observed scanning suggests attackers are testing for exposed services, product-specific backdoors, weak credentials, or stale software.
- Identify the listener, confirm business need, patch the owning system, and restrict public access with deny-by-default rules.
- Known CVE examples: no reliable generic CVE mapping for this port alone; use the NVD and CISA lookups below with the confirmed product and version.
- External vulnerability sources: NVD CVE lookup; CISA KEV exploited-CVE catalog; Exploit-DB public exploit search.

Port 20000 - web/admin service

- Requesting countries in feed: United States Bulgaria Germany United Kingdom China France Taiwan Australia India Japan.
- Web and admin interfaces are common paths for authentication bypass, RCE, file upload, SSRF, and exposed panels.
- Patch frameworks and appliances, remove default credentials, enforce TLS and MFA, and place admin paths behind VPN or allowlists.
- Known CVE examples for common products on this port: CVE-2025-24813, CVE-2024-3400, CVE-2023-3519, CVE-2021-41773. Validate against the actual product and version.
- External vulnerability sources: NVD CVE lookup; CISA KEV exploited-CVE catalog; Exploit-DB public exploit search; OWASP web risk categories.

Port 22222 - alternate SSH/admin

- Requesting countries in feed: Netherlands United States Germany Russian Federation United Kingdom Bulgaria China Hong Kong France Japan.
- Observed scanning suggests attackers are testing for exposed services, product-specific backdoors, weak credentials, or stale software.
- Identify the listener, confirm business need, patch the owning system, and restrict public access with deny-by-default rules.
- Known CVE examples for common products on this port: CVE-2025-24813, CVE-2024-3400, CVE-2023-3519, CVE-2021-41773. Validate against the actual product and version.
- External vulnerability sources: NVD CVE lookup; CISA KEV exploited-CVE catalog; Exploit-DB public exploit search; OWASP web risk categories.

Port 25565 - Minecraft server

- Requesting countries in feed: Germany France United States Netherlands Austria Ukraine China United Kingdom Hong Kong Portugal.
- Observed scanning suggests attackers are testing for exposed services, product-specific backdoors, weak credentials, or stale software.
- Identify the listener, confirm business need, patch the owning system, and restrict public access with deny-by-default rules.
- Known CVE examples: no reliable generic CVE mapping for this port alone; use the NVD and CISA lookups below with the confirmed product and version.
- External vulnerability sources: NVD CVE lookup; CISA KEV exploited-CVE catalog; Exploit-DB public exploit search.

Port 27015 - game server

- Requesting countries in feed: China United States Korea, Republic of Russian Federation Brazil Taiwan South Africa Colombia Vietnam France.
- Observed scanning suggests attackers are testing for exposed services, product-specific backdoors, weak credentials, or stale software.
- Identify the listener, confirm business need, patch the owning system, and restrict public access with deny-by-default rules.
- Known CVE examples: no reliable generic CVE mapping for this port alone; use the NVD and CISA lookups below with the confirmed product and version.
- External vulnerability sources: NVD CVE lookup; CISA KEV exploited-CVE catalog; Exploit-DB public exploit search.

Port 27017 - MongoDB

- Requesting countries in feed: United States United Kingdom Australia Austria Belgium China France Netherlands Germany Canada.
- Databases exposed to the Internet risk credential attacks, unauthenticated access, data theft, ransomware, and destructive writes.
- Bind to private interfaces, require strong authentication and TLS, patch engines, and monitor for unexpected queries or dumps.
- Known CVE examples for common products on this port: CVE-2019-2391, CVE-2021-20329. Validate against the actual product and version.
- External vulnerability sources: NVD CVE lookup; CISA KEV exploited-CVE catalog; Exploit-DB public exploit search.

Port 42781 - high-port scan target

- Requesting countries in feed: China United Kingdom.
- Observed scanning suggests attackers are testing for exposed services, product-specific backdoors, weak credentials, or stale software.
- Identify the listener, confirm business need, patch the owning system, and restrict public access with deny-by-default rules.
- Known CVE examples: no reliable generic CVE mapping for this port alone; use the NVD and CISA lookups below with the confirmed product and version.
- External vulnerability sources: NVD CVE lookup; CISA KEV exploited-CVE catalog; Exploit-DB public exploit search.

Port 42906 - high-port scan target

- Requesting countries in feed: China Bulgaria United States.
- Observed scanning suggests attackers are testing for exposed services, product-specific backdoors, weak credentials, or stale software.
- Identify the listener, confirm business need, patch the owning system, and restrict public access with deny-by-default rules.
- Known CVE examples: no reliable generic CVE mapping for this port alone; use the NVD and CISA lookups below with the confirmed product and version.
- External vulnerability sources: NVD CVE lookup; CISA KEV exploited-CVE catalog; Exploit-DB public exploit search.

Port 42944 - high-port scan target

- Requesting countries in feed: China United States.
- Observed scanning suggests attackers are testing for exposed services, product-specific backdoors, weak credentials, or stale software.
- Identify the listener, confirm business need, patch the owning system, and restrict public access with deny-by-default rules.
- Known CVE examples: no reliable generic CVE mapping for this port alone; use the NVD and CISA lookups below with the confirmed product and version.
- External vulnerability sources: NVD CVE lookup; CISA KEV exploited-CVE catalog; Exploit-DB public exploit search.

Port 43113 - high-port scan target

- Requesting countries in feed: China United States.
- Observed scanning suggests attackers are testing for exposed services, product-specific backdoors, weak credentials, or stale software.
- Identify the listener, confirm business need, patch the owning system, and restrict public access with deny-by-default rules.
- Known CVE examples: no reliable generic CVE mapping for this port alone; use the NVD and CISA lookups below with the confirmed product and version.
- External vulnerability sources: NVD CVE lookup; CISA KEV exploited-CVE catalog; Exploit-DB public exploit search.

Port 43334 - high-port scan target

- Requesting countries in feed: China.
- Observed scanning suggests attackers are testing for exposed services, product-specific backdoors, weak credentials, or stale software.
- Identify the listener, confirm business need, patch the owning system, and restrict public access with deny-by-default rules.
- Known CVE examples: no reliable generic CVE mapping for this port alone; use the NVD and CISA lookups below with the confirmed product and version.
- External vulnerability sources: NVD CVE lookup; CISA KEV exploited-CVE catalog; Exploit-DB public exploit search.

Port 43373 - high-port scan target

- Requesting countries in feed: China United States.
- Observed scanning suggests attackers are testing for exposed services, product-specific backdoors, weak credentials, or stale software.
- Identify the listener, confirm business need, patch the owning system, and restrict public access with deny-by-default rules.
- Known CVE examples: no reliable generic CVE mapping for this port alone; use the NVD and CISA lookups below with the confirmed product and version.
- External vulnerability sources: NVD CVE lookup; CISA KEV exploited-CVE catalog; Exploit-DB public exploit search.

Port 43401 - high-port scan target

- Requesting countries in feed: China United States.
- Observed scanning suggests attackers are testing for exposed services, product-specific backdoors, weak credentials, or stale software.
- Identify the listener, confirm business need, patch the owning system, and restrict public access with deny-by-default rules.
- Known CVE examples: no reliable generic CVE mapping for this port alone; use the NVD and CISA lookups below with the confirmed product and version.
- External vulnerability sources: NVD CVE lookup; CISA KEV exploited-CVE catalog; Exploit-DB public exploit search.

Port 44090 - high-port scan target

- Requesting countries in feed: China United States.
- Observed scanning suggests attackers are testing for exposed services, product-specific backdoors, weak credentials, or stale software.
- Identify the listener, confirm business need, patch the owning system, and restrict public access with deny-by-default rules.
- Known CVE examples: no reliable generic CVE mapping for this port alone; use the NVD and CISA lookups below with the confirmed product and version.
- External vulnerability sources: NVD CVE lookup; CISA KEV exploited-CVE catalog; Exploit-DB public exploit search.

Port 44697 - high-port scan target

- Requesting countries in feed: China.
- Observed scanning suggests attackers are testing for exposed services, product-specific backdoors, weak credentials, or stale software.
- Identify the listener, confirm business need, patch the owning system, and restrict public access with deny-by-default rules.
- Known CVE examples: no reliable generic CVE mapping for this port alone; use the NVD and CISA lookups below with the confirmed product and version.
- External vulnerability sources: NVD CVE lookup; CISA KEV exploited-CVE catalog; Exploit-DB public exploit search.

Port 44789 - high-port scan target

- Requesting countries in feed: China.
- Observed scanning suggests attackers are testing for exposed services, product-specific backdoors, weak credentials, or stale software.
- Identify the listener, confirm business need, patch the owning system, and restrict public access with deny-by-default rules.
- Known CVE examples: no reliable generic CVE mapping for this port alone; use the NVD and CISA lookups below with the confirmed product and version.
- External vulnerability sources: NVD CVE lookup; CISA KEV exploited-CVE catalog; Exploit-DB public exploit search.

Port 45232 - high-port scan target

- Requesting countries in feed: China.
- Observed scanning suggests attackers are testing for exposed services, product-specific backdoors, weak credentials, or stale software.
- Identify the listener, confirm business need, patch the owning system, and restrict public access with deny-by-default rules.
- Known CVE examples: no reliable generic CVE mapping for this port alone; use the NVD and CISA lookups below with the confirmed product and version.
- External vulnerability sources: NVD CVE lookup; CISA KEV exploited-CVE catalog; Exploit-DB public exploit search.

Port 45330 - high-port scan target

- Requesting countries in feed: China.
- Observed scanning suggests attackers are testing for exposed services, product-specific backdoors, weak credentials, or stale software.
- Identify the listener, confirm business need, patch the owning system, and restrict public access with deny-by-default rules.
- Known CVE examples: no reliable generic CVE mapping for this port alone; use the NVD and CISA lookups below with the confirmed product and version.
- External vulnerability sources: NVD CVE lookup; CISA KEV exploited-CVE catalog; Exploit-DB public exploit search.

Port 45417 - high-port scan target

- Requesting countries in feed: China.
- Observed scanning suggests attackers are testing for exposed services, product-specific backdoors, weak credentials, or stale software.
- Identify the listener, confirm business need, patch the owning system, and restrict public access with deny-by-default rules.
- Known CVE examples: no reliable generic CVE mapping for this port alone; use the NVD and CISA lookups below with the confirmed product and version.
- External vulnerability sources: NVD CVE lookup; CISA KEV exploited-CVE catalog; Exploit-DB public exploit search.

Port 45661 - high-port scan target

- Requesting countries in feed: China United States.
- Observed scanning suggests attackers are testing for exposed services, product-specific backdoors, weak credentials, or stale software.
- Identify the listener, confirm business need, patch the owning system, and restrict public access with deny-by-default rules.
- Known CVE examples: no reliable generic CVE mapping for this port alone; use the NVD and CISA lookups below with the confirmed product and version.
- External vulnerability sources: NVD CVE lookup; CISA KEV exploited-CVE catalog; Exploit-DB public exploit search.

Port 49152 - Windows RPC dynamic/high ephemeral

- Requesting countries in feed: United States China Germany India Argentina Hong Kong Latvia Netherlands Pakistan Russian Federation.
- Windows remote access surfaces are heavily scanned for weak credentials, lateral-movement services, and historical RCE classes.
- Keep off the public Internet where possible; require VPN, NLA/MFA, current patches, and strict firewall source controls.
- Known CVE examples for common products on this port: CVE-2017-0144, CVE-2019-0708, CVE-2020-0796. Validate against the actual product and version.
- External vulnerability sources: NVD CVE lookup; CISA KEV exploited-CVE catalog; Exploit-DB public exploit search.

Port 50001 - IoT/web admin service

- Requesting countries in feed: United States Singapore Bulgaria United Kingdom Germany China India Romania Ukraine France.
- Web and admin interfaces are common paths for authentication bypass, RCE, file upload, SSRF, and exposed panels.
- Patch frameworks and appliances, remove default credentials, enforce TLS and MFA, and place admin paths behind VPN or allowlists.
- Known CVE examples for common products on this port: CVE-2025-24813, CVE-2024-3400, CVE-2023-3519, CVE-2021-41773. Validate against the actual product and version.
- External vulnerability sources: NVD CVE lookup; CISA KEV exploited-CVE catalog; Exploit-DB public exploit search; OWASP web risk categories.

Port 54321 - IoT/admin service

- Requesting countries in feed: United States Hong Kong Bulgaria Germany Singapore United Kingdom Netherlands Ukraine China Malaysia.
- Industrial, router, and IoT management services often expose unauthenticated commands, default passwords, and old firmware.
- Do not expose directly; segment networks, update firmware, disable unused management APIs, and allowlist operators.
- Known CVE examples for common products on this port: CVE-2025-24813, CVE-2024-3400, CVE-2023-3519, CVE-2021-41773. Validate against the actual product and version.
- External vulnerability sources: NVD CVE lookup; CISA KEV exploited-CVE catalog; Exploit-DB public exploit search; OWASP web risk categories.

Port 54322 - IoT/admin service

- Requesting countries in feed: United States Hong Kong Bulgaria Germany Seychelles United Kingdom.
- Industrial, router, and IoT management services often expose unauthenticated commands, default passwords, and old firmware.
- Do not expose directly; segment networks, update firmware, disable unused management APIs, and allowlist operators.
- Known CVE examples for common products on this port: CVE-2025-24813, CVE-2024-3400, CVE-2023-3519, CVE-2021-41773. Validate against the actual product and version.
- External vulnerability sources: NVD CVE lookup; CISA KEV exploited-CVE catalog; Exploit-DB public exploit search; OWASP web risk categories.

Port 54443 - HTTPS alternate/admin

- Requesting countries in feed: United States Hong Kong Germany Bulgaria Canada.
- Web and admin interfaces are common paths for authentication bypass, RCE, file upload, SSRF, and exposed panels.
- Patch frameworks and appliances, remove default credentials, enforce TLS and MFA, and place admin paths behind VPN or allowlists.
- Known CVE examples for common products on this port: CVE-2025-24813, CVE-2024-3400, CVE-2023-3519, CVE-2021-41773. Validate against the actual product and version.
- External vulnerability sources: NVD CVE lookup; CISA KEV exploited-CVE catalog; Exploit-DB public exploit search; OWASP web risk categories.

Port 61616 - Apache ActiveMQ

- Requesting countries in feed: United States United Kingdom Germany China Taiwan France Hong Kong Bulgaria Netherlands Switzerland.
- Message brokers are targeted for anonymous access, weak credentials, unsafe deserialization, and data exfiltration.
- Disable anonymous clients, require TLS and auth, patch broker software, and restrict management consoles.
- Known CVE examples for common products on this port: CVE-2023-46604, CVE-2016-3088. Validate against the actual product and version.
- External vulnerability sources: NVD CVE lookup; CISA KEV exploited-CVE catalog; Exploit-DB public exploit search.

External Vulnerability Sources

The per-port links are service-oriented lookups, not claims that every CVE returned by a search applies to the listener in your environment. Known CVE examples are representative historical or recent issues for common products on the port; use them to validate the exact product, version, configuration, and exposure before taking remediation action.

- NIST National Vulnerability Database: official U.S. government vulnerability search for CVE records, severity, affected products, and references.
- CISA Known Exploited Vulnerabilities Catalog: exploited-in-the-wild CVEs prioritized for remediation.
- CVE Program: canonical CVE identifiers and assignment records.
- OWASP Top 10:2025: application-security risk categories used for web, API, proxy, and admin-interface exposures.
- Exploit-DB: public exploit and proof-of-concept search used as an additional triage signal.
